PATENT  
Filed: January 26, 2001

1. (currently amended) A method for broadcast encryption, comprising:  
assigning each user in a group of users respective private information  $I_u$ ;  
selecting at least one session encryption key  $K$ ;  
partitioning users not in a revoked set  $R$  into disjoint subsets  $S_{i1}, \dots, S_{im}$  having associated subset keys  $L_{i1}, \dots, L_{im}$ ; [and]  
encrypting the session key  $K$  with the subset keys  $L_{i1}, \dots, L_{im}$  to render  $m$  encrypted versions of the session key  $K$ ;

partitioning the users into groups  $S_1, \dots, S_w$ , wherein "w" is an integer, and the groups establish subtrees in a tree, wherein each subset  $S_{i1}, \dots, S_{im}$  includes all leaves in a subtree rooted at some node  $v_i$ , at least each node in the subtree being associated with a respective subset key, wherein content is provided to users in at least one message defining a header, and the header includes at most  $r \cdot \log(N/r)$  subset keys and encryptions, wherein  $r$  is the number of users in the revoked set  $R$  and  $N$  is the total number of users.

2. (canceled).

3. (currently amended) The method of Claim [2]1, wherein the tree is a complete binary tree.

4. (original) The method of Claim 1, further comprising using private information  $I_u$  to decrypt the session key.

5. (original) The method of Claim 4, wherein the act of decrypting includes using information  $i_j$  such that a user belongs to a subset  $S_{ij}$ , and retrieving a subset key  $L_{ij}$  using the private information of the user.

6. (canceled).

7. (canceled).

8. (currently amended) The method of Claim [6]1, wherein each user must store  $\log N$  keys, wherein  $N$  is the total number of users.

9. (currently amended) ~~The method of Claim 6~~ A method for broadcast encryption, comprising:  
assigning each user in a group of users respective private information  $L_i$ ;  
selecting at least one session encryption key  $K$ ;  
partitioning users not in a revoked set  $R$  into disjoint subsets  $S_{11}, \dots, S_{1m}$  having associated subset keys  $L_{11}, \dots, L_{1m}$ ; [and]  
encrypting the session key  $K$  with the subset keys  $L_{11}, \dots, L_{1m}$  to render  $m$  encrypted versions of the session key  $K$ ;  
partitioning the users into groups  $S_1, \dots, S_w$ , wherein " $w$ " is an integer, and the groups establish subtrees in a tree, wherein each subset  $S_{11}, \dots, S_{1m}$  includes all leaves in a subtree rooted at some node  $v_i$ , at least each node in the subtree being associated with a respective subset key, wherein

content is provided to users in at least one message, and wherein each user processes the message using at most  $\log \log N$  operations plus a single decryption operation, wherein  $N$  is the total number of users.

10. (currently amended) The method of Claim [6]1, wherein the revoked set  $R$  defines a spanning tree, and subtrees having roots attached to nodes of the spanning tree define the subsets.

11. (currently amended) The method of Claim [2]1, wherein the tree includes a root and plural nodes, each node having at least one associated label, and wherein each subset includes all leaves in a subtree rooted at some node  $v_i$  that are not in the subtree rooted at some other node  $v_j$  that descends from  $v_i$ .

12. (currently amended) ~~The method of Claim 11~~ A method for broadcast encryption, comprising:  
assigning each user in a group of users respective private information  $L_i$ ;

selecting at least one session encryption key  $K$ ;

partitioning users not in a revoked set  $R$  into disjoint subsets  $S_1, \dots, S_m$  having associated subset keys  $L_{q_1}, \dots, L_{q_m}$ ;

encrypting the session key  $K$  with the subset keys  $L_{q_1}, \dots, L_{q_m}$  to render  $m$  encrypted versions of the session key  $K$ ;

partitioning the users into groups  $S_1, \dots, S_w$ , wherein " $w$ " is an integer, and the groups establish subtrees in a tree, wherein the tree includes a root and plural nodes, each node having at least one associated label, and wherein each subset includes all leaves in a subtree rooted at some

partitioning users not in a revoked set R into disjoint subsets  $S_{i1}, \dots, S_{im}$  having associated subset keys  $L_{i1}, \dots, L_{im}$ ; and  
encrypting the session key K with the subset keys  $L_{i1}, \dots, L_{im}$  to render m encrypted versions of the session key K, wherein content is provided to users in at least one message defining plural portions, and each portion is encrypted with a respective session key.

21. (currently amended) A computer program device, comprising:

a computer program storage device including a program of instructions usable by a computer, comprising:

logic means for accessing a tree to identify plural subset keys;

logic means for encrypting a message with a session key;

logic means for encrypting the session key at least once with each of the subset keys to render encrypted versions of the session key; [and]

logic means for sending the encrypted versions of the session key in a header of the message to plural stateless receivers, wherein logic means provide content to receivers in at least one message, and wherein each receiver processes the message using at most  $\log \log N$  operations plus a single decryption operation, wherein N is the total number of receivers.

22. (original) The computer program device of Claim 21, further comprising:

logic means for partitioning receivers not in a revoked set R into disjoint subsets  $S_{i1}, \dots, S_{im}$  having associated subset keys  $L_{i1}, \dots, L_{im}$ .

content, wherein content is provided to receivers in at least one message, and wherein each receiver processes the message using at most  $\log \log N$  operations plus a single decryption operation, wherein  $N$  is the total number of receivers.

50. (currently amended) The computer of Claim [46]41, wherein the revoked set  $R$  defines a spanning tree, and subtrees having roots attached to nodes of the spanning tree define the subsets.

51. (original) The computer of Claim 41[43], wherein the tree includes a root and plural nodes, each node having at least one associated label, and wherein each subset includes all leaves in a subtree rooted at some node  $v_i$  that are not in the subtree rooted at some other node  $v_j$  that descends from  $v_i$ .

52. (original) The computer of Claim 51, wherein content is provided to receivers in at least one message defining a header, and the header includes at most  $2r-1$  subset keys and encryptions, wherein  $r$  is the number of receivers in the revoked set  $R$ .

53. (original) The computer of Claim 51, wherein each receiver must store  $.5\log^2 N + .5\log N + 1$  keys, wherein  $N$  is the total number of receivers.

54. (original) The computer of Claim 51, wherein content is provided to receivers in at least one message, and wherein each receiver processes the message using at most  $\log N$  operations plus a single decryption operation, wherein  $N$  is the total number of receivers.

PATENT  
Filed: January 26, 2001

55. (original) The computer of Claim 51, wherein the revoked set R defines a spanning tree, and wherein the method acts undertaken by the computer further include:

initializing a cover tree T as the spanning tree;

iteratively removing nodes from the cover tree T and adding nodes to a cover until the cover tree T has at most one node.

56. (original) The computer of Claim 55, wherein the computer assigns node labels to receivers from the tree using a pseudorandom sequence generator.

57. (original) The computer of Claim 56, wherein the act of decrypting undertaken by the computer includes evaluating the pseudorandom sequence generator.

58. (currently amended) ~~The computer of Claim 44~~ A computer programmed with instructions to cause the computer to execute method acts including:

encrypting broadcast content;

sending the broadcast content to plural stateless receivers and to at least one revoked receiver such that each stateless receiver can decrypt the content and the revoked receiver cannot decrypt the content, wherein content is provided to receivers in at least one message having a header including a cryptographic function  $E_i$ , and the method acts undertaken by the computer include prefix-truncating the cryptographic function  $E_i$ .

59. (currently amended) ~~The computer of Claim 41~~ A computer programmed with instructions to cause the computer to execute method acts including:

encrypting broadcast content;

sending the broadcast content to plural stateless receivers and to at least one revoked receiver such that each stateless receiver can decrypt the content and the revoked receiver cannot decrypt the content, wherein content is provided to receivers in at least one message defining plural portions, and each portion is encrypted by the computer with a respective session key.

60. (original) The method of Claim 11, wherein each node has plural labels with each ancestor of the node inducing a respective label, and wherein each user is assigned labels from all nodes hanging from a direct path between the user and the root but not from nodes in the direct path.

61-64. (canceled).

65. (previously presented) A receiver of content, comprising:

means for storing respective private information  $I_u$ ;

means for receiving at least one session encryption key  $K$  encrypted with plural subset keys, the session key encrypting content; and

means for obtaining at least one subset key using the private information such that the session key  $K$  can be decrypted to play the content, wherein the receiver receives content in at least one

message defining a header, and the header includes at most  $r \cdot \log(N/r)$  subset keys and encryptions, wherein  $r$  is the number of receivers in a revoked set  $R$  and  $N$  is the total number of receivers.

66. (original) The receiver of Claim 65, wherein the receiver is partitioned into one of a set of groups  $S_1, \dots, S_w$ , wherein " $w$ " is an integer, and the groups establish subtrees in a tree defining nodes and leaves.

67. (original) The receiver of Claim 66, wherein subsets  $S_{i1}, \dots, S_{im}$  derived from the set of groups  $S_1, \dots, S_w$  define a cover.

68. (canceled).

69. (original) The receiver of Claim 67, wherein the receiver must store  $\log N$  keys, wherein  $N$  is the total number of receivers.

70. (previously presented) A receiver of content, comprising:

means for storing respective private information  $I_u$ ;

means for receiving at least one session encryption key  $K$  encrypted with plural subset keys, the session key encrypting content; and

means for obtaining at least one subset key using the private information such that the session key  $K$  can be decrypted to play the content, wherein the receiver receives content in at least one

message defining a header, and wherein the receiver processes the message using at most  $\log \log N$  operations plus a single decryption operation, wherein  $N$  is the total number of receivers.

71. (original) The receiver of Claim 67, wherein a revoked set  $R$  defines a spanning tree, and subtrees having roots attached to nodes of the spanning tree define the subsets.

72. (original) The receiver of Claim 67, wherein the tree includes a root and plural nodes, each node having at least one associated label, and wherein each subset includes all leaves in a subtree rooted at some node  $v_i$  that are not in the subtree rooted at some other node  $v_j$  that descends from  $v_i$ .

73. (previously presented) A receiver of content, comprising:

- means for storing respective private information  $I_u$ ;
- means for receiving at least one session encryption key  $K$  encrypted with plural subset keys, the session key encrypting content; and
- means for obtaining at least one subset key using the private information such that the session key  $K$  can be decrypted to play the content, wherein the receiver receives content in a message having a header including at most  $2r-1$  subset keys and encryptions, wherein  $r$  is the number of receivers in the revoked set  $R$ .

74. (previously presented) A receiver of content, comprising:

- means for storing respective private information  $I_u$ ;

means for receiving at least one session encryption key K encrypted with plural subset keys, the session key encrypting content; and

means for obtaining at least one subset key using the private information such that the session key K can be decrypted to play the content, wherein the receiver must store  $.5\log^2 N + .5\log N + 1$  keys, wherein N is the total number of receivers.

75. (previously presented) A receiver of content, comprising:

means for storing respective private information  $I_u$ ;

means for receiving at least one session encryption key K encrypted with plural subset keys, the session key encrypting content; and

means for obtaining at least one subset key using the private information such that the session key K can be decrypted to play the content, wherein content is provided to the receiver in at least one message, and wherein the receiver processes the message using at most  $\log N$  operations plus a single decryption operation, wherein N is the total number of receivers.

76. (original) The receiver of Claim 72, wherein the receiver decrypts the subset key by evaluating a pseudorandom sequence generator.

77. (previously presented) A receiver of content, comprising:

a data storage storing respective private information  $I_u$ ;

a processing device receiving at least one session encryption key  $K$  encrypted with plural subset keys, the session key encrypting content, the processing device obtaining at least one subset key using the private information such that the session key  $K$  can be decrypted to play the content, wherein the receiver receives content in at least one message defining a header, and wherein the receiver processes the message using at most  $\log \log N$  operations plus a single decryption operation, wherein  $N$  is the total number of receivers.

78. (original) The receiver of Claim 77, wherein the receiver is partitioned into one of a set of groups  $S_1, \dots, S_w$ , wherein " $w$ " is an integer, and the groups establish subtrees in a tree.

79. (original) The receiver of Claim 78, wherein subsets  $S_{i1}, \dots, S_{im}$  derived from the set of groups  $S_1, \dots, S_w$  define a cover.

80. (original) The receiver of Claim 79, wherein the receiver receives content in at least one message defining a header, and the header includes at most  $r \cdot \log(N/r)$  subset keys and encryptions, wherein  $r$  is the number of receivers in a revoked set  $R$  and  $N$  is the total number of receivers.

81. (original) The receiver of Claim 79, wherein the receiver must store  $\log N$  keys, wherein  $N$  is the total number of receivers.

83. (original) The receiver of Claim 79, wherein one revoked set  $R$  defines a spanning tree, and subtrees having roots attached to nodes of the spanning tree define the subsets.

84. (original) The receiver of Claim 79, wherein the tree includes a root and plural nodes, each node having at least one associated label, and wherein each subset includes all leaves in a subtree rooted at some node  $v_i$  that are not in the subtree rooted at some other node  $v_j$  that descends from  $v_i$ .

85. (original) The receiver of Claim 84, wherein the receiver receives content in a message having a header including at most  $2r-1$  subset keys and encryptions, wherein  $r$  is the number of receivers in the revoked set  $R$ .

86. (original) The receiver of Claim 84, wherein the receiver must store  $.5\log^2 N + .5\log N + 1$  keys, wherein  $N$  is the total number of receivers.

87. (original) The receiver of Claim 84, wherein content is provided to the receiver in at least one message, and wherein the receiver processes the message using at most  $\log N$  operations plus a single decryption operation, wherein  $N$  is the total number of receivers.

88. (original) The receiver of Claim 84, wherein the receiver decrypts the subset key by evaluating a pseudorandom sequence generator.

89-94 (canceled).

95. (currently amended) The computer of Claim [42]41, wherein the act of partitioning is undertaken by a system computer in a system of receivers separate from the system computer.

96. (currently amended) The computer of Claim [42]41, wherein the act of partitioning is undertaken by a receiver computer.

97. (original) The receiver of Claim 67, wherein the receiver derives the subsets in the cover.

98. (previously presented) The computer of Claim 41, wherein the method acts include using private information  $I_s$  to decrypt the session key.
